

Hollow-Back Elbows

Hollow-Back Elbow

Our Hollow-Back elbow is designed to capture abrasive product in the fabricated back cavity. The abrasive material then rides against itself. We fabricate the Hollow-Back by using a tube or pipe elbow, thus eliminating the need for transitions.

Typical construction is 10Ga material. Thicker metal and AR plate is available.

Available in both Carbon Steel and Stainless Steel construction.

This elbow is an excellent choice for higher abrasion applications with material that packs.

It is not recommended for food applications, due to the open voids that can collect material.

Typical Applications

- Sand
- Powdered Coal

Available in plain ends, flanged ends, grooved ends, or other specified ends. Special orders are welcome.
