

Mortar Filled Flat-Back Elbow

aka The Cement-Back Elbow

A perfect balance between abrasion resistance and affordability. This elbow has a cavity back filled with cured concrete, which extends its lifespan far beyond a bare or core elbow. It's fabricated using a pipe or tube elbow to eliminate transitions.

The metal exterior can be constructed from various thicknesses of material. Standard or custom-mix concrete can be used. And for high-heat applications, refractory backing is available instead of cement.

Typical applications:

metals, composite products, aggregates, fly ash, cement

Benefits

- Highly abrasion resistant
- Impact resistant
- Long lifespan
- Lowers costs and downtime
- Improves production
- Easily replaces existing elbows
- Doesn't change line flow

Available in

- Any degree and CLR
- Carbon steel or stainless steel
- Pipe or tube
- Plain ends, flanged ends, grooved ends, or other specified ends

Special orders are welcome.
